

Inspection Checklist

A regular inspection helps ensure your canner operates safely, seals properly, and maintains consistent pressure – which means safe, reliable results every time you preserve food.

Metal-to-Metal Seal

- Remove the lid and inspect for any damage on the seal surface of both the lid and the bottom of the unit.
 - Imperfections on the sealing surfaces can happen over time with use of the unit.
 - If your unit has cracks, or is unable to build or maintain proper pressure please contact customer support at customerrelations@wafco.com or 920-686-2701.

Overpressure Plug

- Inspect before every use for cracks, wear, & debris accumulation.
 - Replace your existing overpressure plug with a new one if you see any of those conditions.
 - Never replace your overpressure plug with a used one.
 - We recommend yearly replacement even without visible signs of wear & tear.

Steam Gauge

- Be sure to inspect the entrance to the steam gauge to be clean ahead of every use.
 - If the steam gauge doesn't display the pressure of your set pressure regulator weight or properly return to 0 after a set cool down period, it may need to be replaced.
 - A good practice is to replace the steam gauge yearly.

Pressure Regulator Weight & Vent Pipe

- Inspect the vent pipe and regulator weight with each use to make sure they are free of debris.
 - Inspect the vent pipe by holding it up to the light.

Wing Nuts, Pins, & Bayonet Clamps

- Inspect all other components for any wear & tear, bending or cracking. Although not common, we still recommend inspecting these components and replacing them when necessary.
